To whom it concern

I hereby prove that Sinyala VFA be registered as a VCA to enhance and alleviate the devastating effects of deforestation which usually affect wildlife and help manage the Area.

In many cases, deforestation will lead to loss of animal habitats, reduction of fuel wood, increases soil erosion, silting of rivers, desertification, relocation of wildlife, reduced construction material, affects water cycle, affects life quality, affects ecosystem, loss of species both fauna and flora (species extinction) and most of all leads to climate change of which have a lot of impacts to the environment since trees act as carbon sinks that store the carbon dioxide that do effect the ozone layer, among other effects.

However, conserving this forest will be the epicentre of different benefits to wildlife.

Yours

Nebart Mtika
